

Building Management System (BMS)

Vad är BMS?

Ett Building Management System (BMS), även kallat Building Automation System (BAS), är ett datorbaserat styrsystem som hanterar och kontrollerar de olika byggnadssystemen, inklusive HVAC, belysning, säkerhet och andra byggnadssystem. Det används för att övervaka och styra byggnadens miljö och se till att den är säker, effektiv och bekväm för de boende.

BMS-systemet för värmepumpar består av hårdvaru- och programvarukomponenter som arbetar tillsammans för att hantera och styra värmepumpsystemet. Hårdvarukomponenterna omfattar givare, styrenheter och ställdon som är installerade i värmepumpsystemet. Programvarukomponenterna omfattar BMS-programvaran som körs på en dator och användargränssnittet som gör det möjligt för fastighetsförvaltare att interagera med systemet.

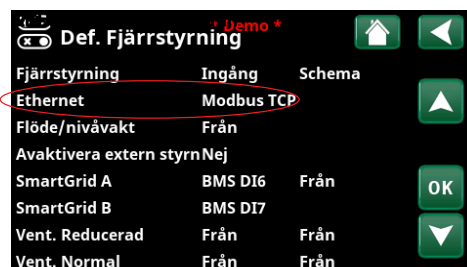

BMS-systemet för värmepumpar fungerar genom att samla in data från värmepumpsystemet, såsom temperatur, tryck och flödes hastighet. Uppgifterna analyseras sedan och används för att styra värmepumpsystemet. T.ex. justering av kompressorns maximala varvtal för att minska energianvändningen i tider då elen är dyr.

Definiera BMS

För att upprätta kommunikation mellan värmepumpen och BMS-systemet måste "Modbus TCP" definieras i displaymenyn "Definiera fjärr" (vid anslutning till displayen via Ethernet-anslutningsporten). För mer information, se värmepumpens Installations- och skötselanvisning.

Endast displayer med 3 anslutningsportar kan anslutas till BMS via TCP/IP.

Ethernet anslutningsport (Modbus TCP/IP)

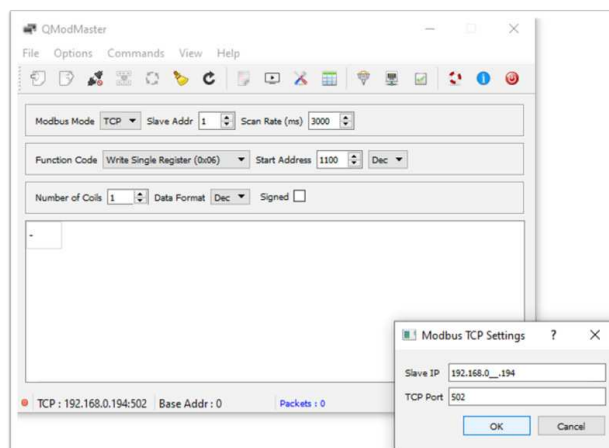

Displaymeny "Avancerat/Definiera/Fjärrstyrning".

Viktigt att komma ihåg!

Ett BMS-system bör endast användas av specialiserade programmerare. Trots detta är det viktigt att veta hur CTC-regulatorn fungerar.

Programmerare bör alltid använda QModMaster när de testar funktionaliteten.

Detta program finns kostnadsfritt på Internet.

Kontrollera att basadressen alltid är 0:

Allmänna data

Registernummer startar över standard Modbus (större än 49999)

Läsa: Analoga Holding Output register

Funktionskod: 0x03H / 3

Skriva: Analoga Holding Output register

Funktionskod: 0x10H / 16

Offset: 0

Max antal register per överföring: 100.

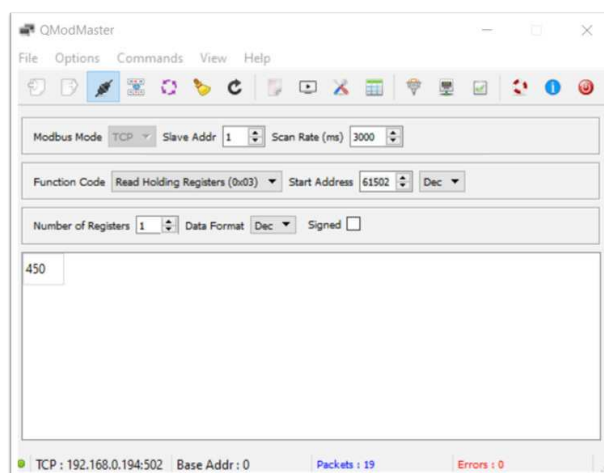

Hur man läser BMS-listan

BMS Register	English	Signed	Read/Write	Max	Min	Step	Visible	Bit	Factor
61500	Hot water mode 0=Economy 1=Normal 2=Comfort	1	RW	60000	60001	60002	62500	0	1
61501	Manual Stop temperature hot water	1	RW	60003	60004	60005	62500	1	0,1
61502	Setting outlet temperature hot water	1	RW	60006	60007	60008	62500	2	0,1
61503	Extra hot water timer	1	RW	60009	60010	60011	62500	3	0,5
61504	Maximum time heating Heat pump	1	RW	60012	60013	60014	62500	4	1
61505	Maximum time hot water	1	RW	60015	60016	60017	62500	5	1
61506	Minimum RPS hot water	1	RW	60018	60019	60020	62500	6	0,1
61507	Minimum RPS Pool	1	RW	60021	60022	60023	62500	7	0,1
61508	Number of vacation days timer	1	RW	60024	60025	60026	62500	8	1
61509	Heating system 1: setting room temp	1	RW	60027	60028	60029	62500	9	0,1
61510	Heating system 2: setting room temp	1	RW	60030	60031	60032	62500	10	0,1
61511	Heating system 3: setting room temp	1	RW	60033	60034	60035	62500	11	0,1
61512	Heating system 4: setting room temp	1	RW	60036	60037	60038	62500	12	0,1

BMS-register

Ett BMS-register är en minnesplats i ett "Building Management System" (BMS) styrsystem som lagrar specifika data relaterade till systemets funktioner. Dessa data kan omfatta temperaturbörvärden, beläggningsnivåer och energianvändningsdata. BMS-programvaran använder register för att övervaka och styra systemen.

t.ex. 61502 : 450 x faktor = 45 (°C)

Beskrivning

Detta är en kort förklaring av betydelsen av BMS-registret.

Signerad

I ett BMS avser "signerad" en datatyp som kan lagra både positiva och negativa värden. Den används för att representera data, t.ex. temperatur, som kan ha ett värdeintervall som inkluderar negativa tal. En "osignerad" datatyp kan endast lagra positiva värden.

R/W

I BMS står "R/W" för "Read/Write" och syftar på möjligheten att läsa och skriva data från ett specifikt register. "R/W"-register kan läsa och skriva data. "R"-register kan endast läsa data (från t.ex. givare).

Max

Max står för Maximalt värde. Detta avser det högsta värde som kan ställas in för en viss parameter i BMS-programvaran. Till exempel den maximala utloppstemperaturen för varmvatten.

Läs data i register 60006. Värdet 650 returneras med en faktor 0,1. Detta innebär att den maximala utloppstemperaturen för varmvatten är 65°C.

Min

Min står för Minsta börvärde: Detta avser det lägsta värde som kan ställas in för en viss parameter i BMS-programvaran. Till exempel den lägsta utloppstemperaturen för varmvatten.

Läs data i register 60007. Värdet 380 returneras med en faktor 0,1. Detta innebär att den lägsta utloppstemperaturen för varmvatten är 38°C.

Steg

Steg är den gradvisa förändring av en parameter som är möjlig. Till exempel intervallet för varmvattnets utloppstemperatur. Läs data i register 60008. Värdet 10 returneras med en faktor 0,1. Detta innebär att steget är 1°C.

Faktor

Detta värde används för att ange den faktor som används för att beräkna det faktiska värdet (temperatur, RPS, timer,...). T.ex., register 60006 : $650 \times 0,1$ (faktor) = 65 (°C).

Synlig & Bit

Dessa två parametrar arbetar tillsammans. Alla register/parametrar är inte synliga. Det beror på produkten och om det är definierat.

t.ex. läser register 62500 : 8575

Översatt i binär form blir detta:

1	0	0	0	0	1	0	1	0	1	1	1	0	1	0	1
12					8							4			0

Bit 7 är 0, vilket innebär att den inte är aktiverad. Detta är poolens lägsta RPS och poolen är inte definierad i detta exempel.

VARNING!

Dessa inställningar får inte ändras många gånger. Om du gör det riskerar du att värmepumpsinstallationens styrenhet fallerar. Det finns en gräns för antalet skrivcykler!

För parametrar som behöver ändras ofta har vi en lösning med register 1000. Se kapitel Styrparametrar.

Styrparametrar

Det finns ett antal 1000-register. Dessa register skall användas för att aktivt styra och reglera parametrar.

Registren måste uppdateras var 5:e minut, annars kommer de att återställas. De kommer också att återställas vid omstart.

Parametrarna kan ställas in så mycket som programmeraren vill, utan några risker.

Styrparametrar för CTC EcoLogic S

För CTC EcoLogic S finns det två specifika register. Det första är till för att starta och stoppa värmepumpen. Det andra är till för att ställa in värmepumpens primärflöde.

Funktion	Adress
Start värmepump	1000
Börvärde framledning	1001

Detta är för kunder som bygger sina egna system där de själva styr shuntar, ventiler etc. och där de använder sin egen logik för vad värmepumpen ska göra.

Styrparametrar för alla andra regulatorer

Funktion	Adress
Max RPS kompressor	1002
Max effekt spetsvärme nedre tank (för alla styrande enheter)	1003
Max effekt spetsvärme övre tank (For CTC EcoZenith i255, CTC EcoZenith i555 och CTC EcoLogic M/L ¹)	1004
Virtuell digital insignal	1100 ²

1 Beroende på valt system

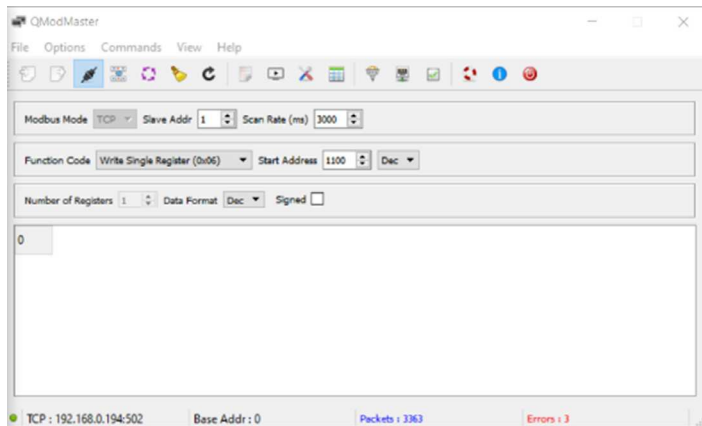

2 Virtuella digitala ingångar, istället för K22-K24 för samma funktioner

T.ex. för ett värmesystem kan värmekurvan ställas in och sedan kan adress 1002 styras för att få önskad värmetillförsel från värmepumpen.

Även elpatronen kan begränsas/styras med dessa register.

Virtuella digitala ingångar (Register 1100)

Virtuella digitala ingångar är programvarubaserade ingångar som simulerar fysiska ingångar i ett BMS. De används när fysiska ingångar inte är tillgängliga eller inte kan installeras. De kan t.ex. användas för CTC-funktionen Smart elprisstyrning.

1)

PIN	BIT
BMS Di 0	Bit 0
BMS Di 1	Bit 1
BMS Di 2	Bit 2
BMS Di 3	Bit 3
BMS Di 4	Bit 4
BMS Di 5	Bit 5
BMS Di 6	Bit 6
BMS Di 7	Bit 7

Om register 1100 är 0 betyder det att alla 8 bitarna (0 till 7) är öppna.

10010 = **0**

HEX	DEC	OCT	BIN
0	0	0	0

BIT	60	56	52	48
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0

Om register 1100 är 255 betyder det att alla 8 bitarna (0 till 7) är stängda.

10010 = **255**

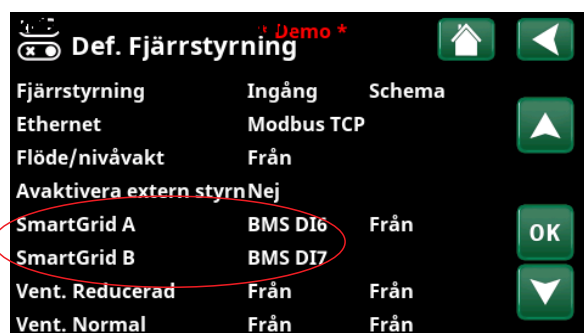

HEX	DEC	OCT	BIN
FF	255	377	1111 1111

BIT	60	56	52	48
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0

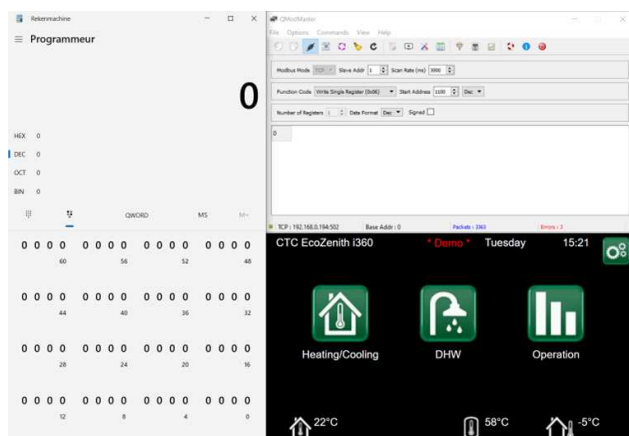

Exempel med SmartGrid

I detta exempel använder vi digital ingång 6 (DI6) för SmartGrid A och digital ingång 7 (DI7) för SmartGrid B. För enkelhetens skull antar vi att andra digitala ingångar inte används.

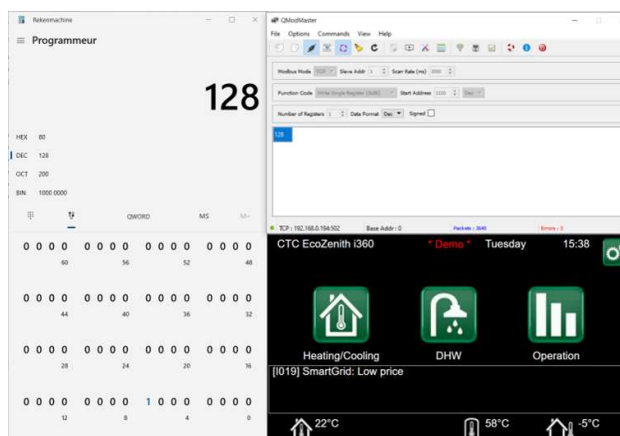

K22 (SG A)	K23 (SG B)	Funktion
Öppen	Öppen	Normal
Öppen	Sluten	Lågpris
Sluten	Sluten	Överkapacitet
Sluten	Öppen	Blockering

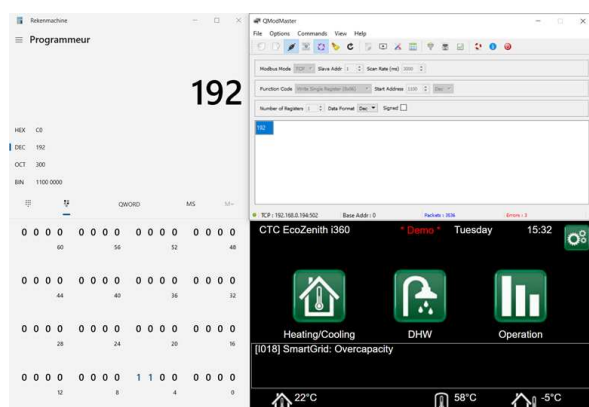

Funktion SG Normal

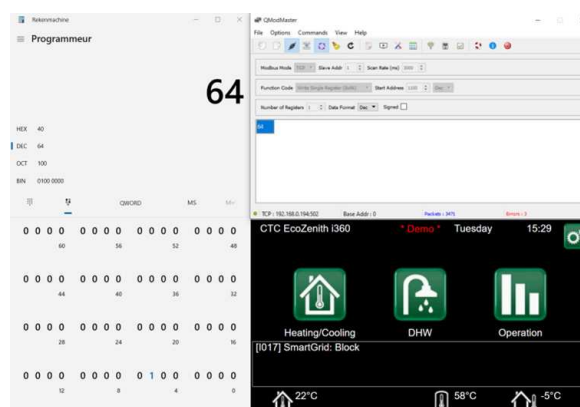

Funktion SG Lågpris

Funktion SG Överkapacitet

Funktion SG Blockering

Anmärkning: Prioriteringen för SmartGrid är:

1. Fjärrstyrning (BMS/digitala ingångar/...)
2. myUplink
3. Veckoschema
4. Inställning

Om båda kontakterna är öppna (normal drift) finns det naturligtvis ingen prioritet för BMS eller ingångarna.

Larm och informationstexter

För larm och informationstexter arbetar vi i två steg.

- Första steget (Hur många larm/informationstexter har vi?)
- Andra steget (Vilket är det exakta larmet/informationstexten?)

Hur många larm/infotexter har vi?

För att veta hur många larm/infotexter man har bör man läsa **register 65133**.

Du måste se på siffran på ett hexadecimalt sätt för att veta hur många larm och hur många infotexter du har.

De första två siffrorna är för infotexterna, de andra två siffrorna är för larmen.

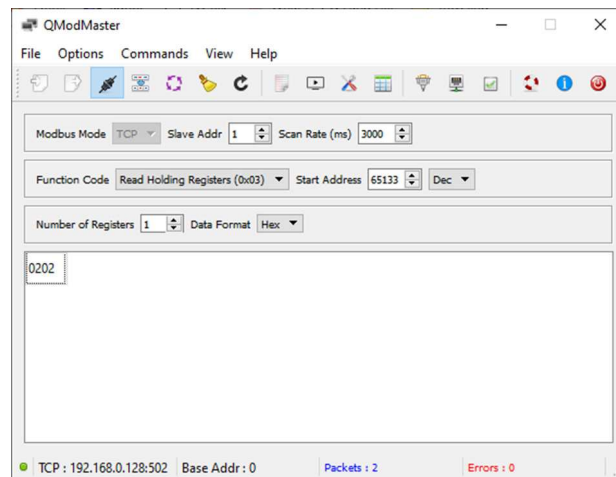

Det absoluta maxantalet du kan ha är FFFF (eller 255 infotexter och 255 larm).

Ett exempel:

#0202 (I hex)

=> 02 = 2 informationstexter

=> 02 = 2 larm

Vad betyder larmet/infotexten?

I nästa steg kan du se mer detaljerad information om larmen och infotexterna.

Läsning av register 65133 måste föregå detta steg eftersom det fyller på data i buffertarna.

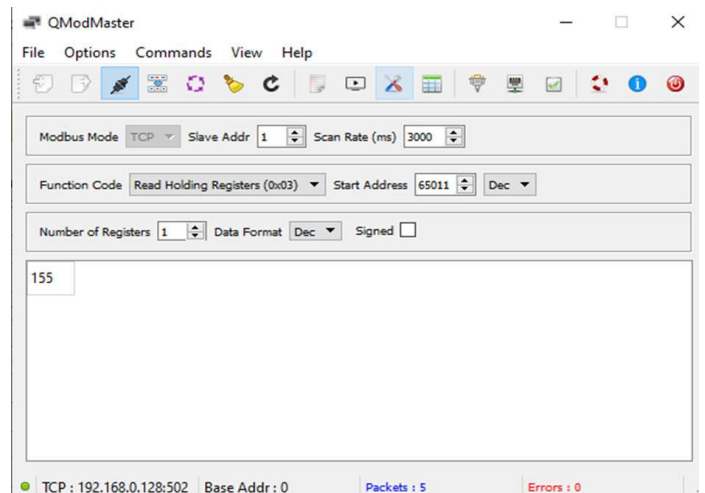

Register	
Larm	65010 - 65059
Infotexter	65060 - 65069

Register	Larmnummer	Förklaring
65010	1	VP-larm (VP 1-10). '1' om det är ett VP-larm, '0' om det är ett annat larm, t.ex. problem med sensorn EcoZenith).
65011	1	Den faktiska larmkoden.
65012	2	VP-larm (VP 1-10). '1' om det är ett VP-larm, '0' om det är ett annat larm, t.ex. problem med sensorn EcoZenith).
65013	2	Den faktiska larmkoden.
65014	3	VP-larm (VP 1-10). '1' om det är ett VP-larm, '0' om det är ett annat larm, t.ex. problem med sensorn EcoZenith).
65015	3	Den faktiska larmkoden.
65016	4	...

Register	Larmnummer	Förklaring
65060	1	VP-infotext (VP 1-10). '1' om det är en VP-infotext, '0' om det är en annan infotext, t.ex. HC1 Värme av).
65061	1	Den faktiska informationstextkoden.
65062	2	VP-infotext (VP 1-10). '1' om det är en VP-infotext, '0' om det är en annan infotext, t.ex. HC1 Värme av).
65063	2	Den faktiska informationstextkoden.
65064	3	...

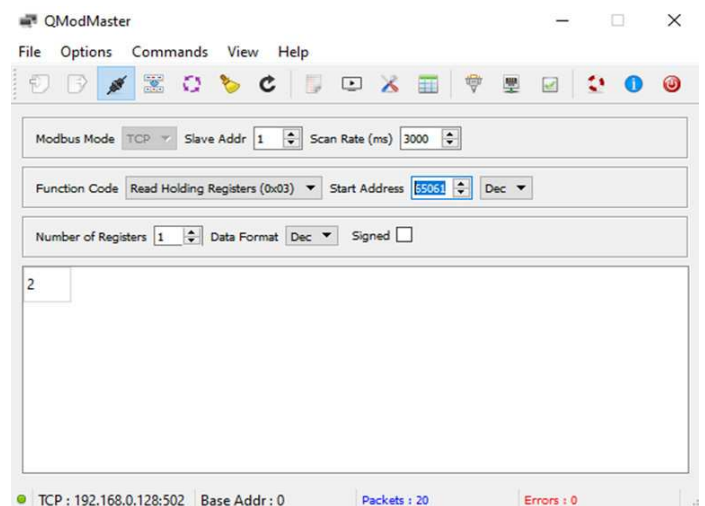

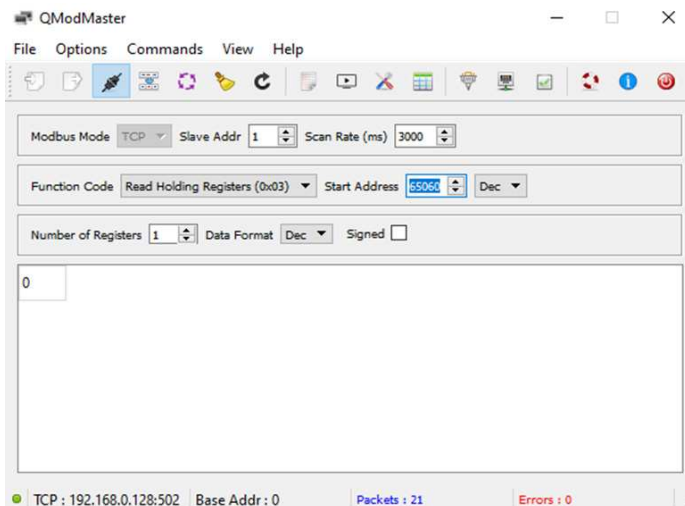

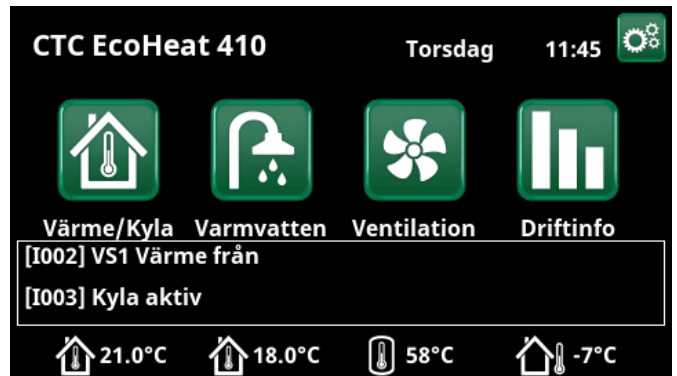

Ett exempel för larm

Register	Larmnummer	Värde	Förklaring
65010	1	0	Inte ett VP-larm
65011	1	E155	SmartControl
65012	2	0	Inte ett VP-larm
65013	2	E158	Larm vent. Filter
65014	3	0	N/A, inget 3:e larm
65015	3	0	N/A

Ett exempel för informationstexter

Register	Larmnummer	Värde	Förklaring
65060	1	0	Inte VP-info
65061	1	I2	VS1 Värme från
65062	2	0	Inte VP-info
65063	2	I3	Kyla aktiv
65064	3	0	N/A, inget 3:e larm
65065	3	0	N/A

Modbus adressregister

På följande sidor visas en komplett förteckning över aktuella BMS-adressregister.

Observera att inte alla parametrar i BMS-listan kan användas för värmepumpsstyrning om din display inte är utrustad med 3 anslutningsportar (BMS via TCP/IP).

Building Management System (BMS)

What is BMS?

A Building Management System (BMS), also known as a Building Automation System (BAS), is a computer-based control system that manages and controls the various building systems, including HVAC, lighting, security, and other building systems. It is used to monitor and control the building's environment, ensuring that it is safe, efficient, and comfortable for the occupants.

The BMS system for heat pumps is composed of hardware and software components that work together to manage and control the heat pump system. The hardware components include sensors, controllers, and actuators that are installed in the heat pump system. The software components include the BMS software application that runs on a computer and the user interface that allows building managers to interact with the system.

The BMS system for heat pumps operates by collecting data from heat pump system, such as temperature, pressure, and flow rate. The data is then analysed and used to control the heat pump system. E.g adjusting the Max compressor speed to reduce energy use in times where electricity is expensive.

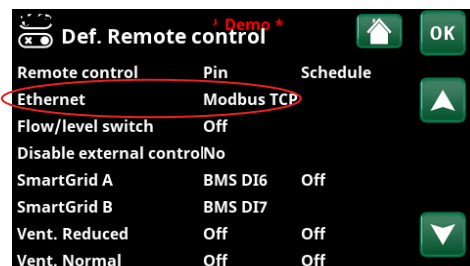

Define BMS

To establish communication between the heat pump and the BMS system, "Modbus TCP" must be defined in the display menu "Define remote" (if connecting to the display via the Ethernet connection port). For more information, see the heat pump user manual.

Only displays with 3 ports can use BMS via TCP/IP.

Ethernet connection port (Modbus TCP/IP)

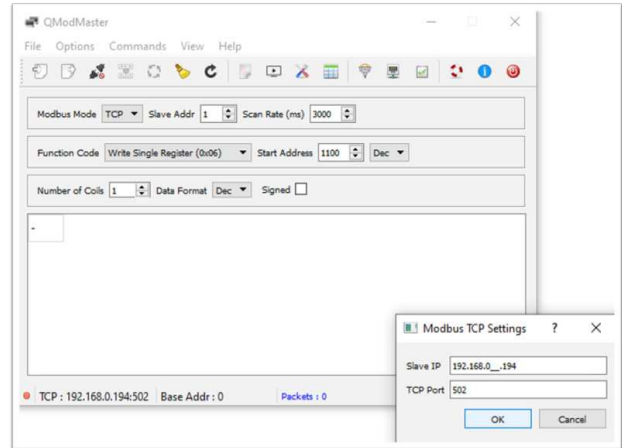

Display menu "Installer/Define/Remote Control".

Important to remember!

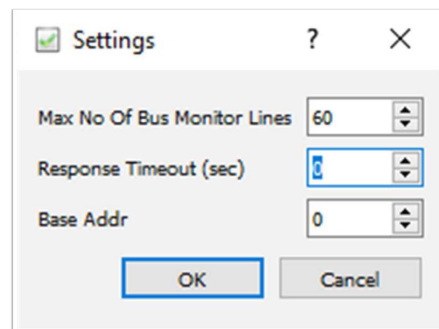

A BMS system should only be used by specialist programmers. Nevertheless, it is crucial to know how the CTC controller works.

Programmers should always use QModMaster if they are testing the functionality.

This program can be found free of charge on the internet.

Make sure the base address is always set to 0:

General data

Register number starts above standard Modbus (larger than 49999)

Reading: Analogue Output Holding Registers

Function code: 0x03H / 3

Writing: Analogue Output Holding Registers

Function code: 0x10H / 16

Offset: 0

Max register per transmission: 100.

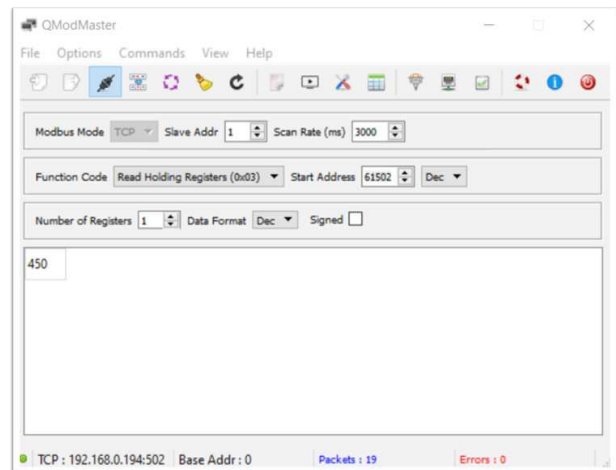

How to read the BMS list

BMS Register	English	Signed	Read/Write	Max	Min	Step	Visible	Bit	Factor
61500	Hot water mode 0=Economy 1=Normal 2=Comfort	1	RW	60000	60001	60002	62500	0	1
61501	Manual Stop temperature hot water	1	RW	60003	60004	60005	62500	1	0,1
61502	Setting outlet temperature hot water	1	RW	60006	60007	60008	62500	2	0,1
61503	Extra hot water timer	1	RW	60009	60010	60011	62500	3	0,5
61504	Maximum time heating Heat pump	1	RW	60012	60013	60014	62500	4	1
61505	Maximum time hot water	1	RW	60015	60016	60017	62500	5	1
61506	Minimum RPS hot water	1	RW	60018	60019	60020	62500	6	0,1
61507	Minimum RPS Pool	1	RW	60021	60022	60023	62500	7	0,1
61508	Number of vacation days timer	1	RW	60024	60025	60026	62500	8	1
61509	Heating system 1: setting room temp	1	RW	60027	60028	60029	62500	9	0,1
61510	Heating system 2: setting room temp	1	RW	60030	60031	60032	62500	10	0,1
61511	Heating system 3: setting room temp	1	RW	60033	60034	60035	62500	11	0,1
61512	Heating system 4: setting room temp	1	RW	60036	60037	60038	62500	12	0,1

BMS Register

A BMS register is a memory location in a Building Management System (BMS) controller that stores specific data related to building system functions. The data can include temperature setpoints, occupancy levels, and energy usage data. The BMS software uses registers to monitor and control the building systems.

e.g. 61502 : 450 x factor = 45 (°C)

Description

This is the explanation in short text of the meaning of the BMS register.

Signed

In a BMS, "signed" refers to a data type that can store both positive and negative values. It is used to represent data, such as temperature, that can have a range of values that includes negative numbers. An "unsigned" data type can only store positive values.

R/W

In BMS, "R/W" stands for "Read/Write" and refers to the ability to read and write data from a specific register. "R/W" registers can read and write data. "R" registers can only read data (e.g. sensors)

Control parameters

There are a number of 1000 registers. These registers are to be used to actively control and regulate parameters. These records need to be updated every 5 minutes or they will be reset. They will also be reset on restart.

These parameters can be set as much as the programmer wants, without any risks.

Control parameters for CTC EcoLogic S

For CTC EcoLogic S there are 2 specific registers. The first one is for starting and stopping the heat pump. The second one is for setting the primary flow of the heat pump.

Function	Address
Start heat pump	1000
Setpoint for primary flow	1001

This is for customers who build their own systems where they themselves control shunts, switch valves, tips etc. and where they use their own logic for what the heat pump should do.

Control parameters for all other controllers

Function	Address
Max RPS compressor	1002
Max power immersion heater lower tank (For all controllers)	1003
Max power immersion heater upper tank (For CTC EcoZenith i255, CTC EcoZenith i555 and CTC EcoLogic M/L ¹)	1004
Virtual digital in	1100 ²

¹ Depending on the selected system

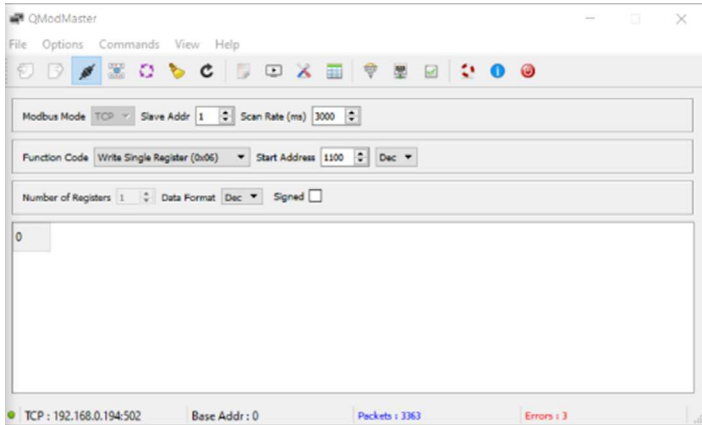

² Virtual digital inputs, instead of K22-K24 for the same functions

E.g. for a heating system high heating curve can be set and then address 1002 can be controlled to obtain the desired supply from the heat pump.

The immersion heater can also be limited/controlled with these registers.

Virtual Digital inputs (Register 1100)

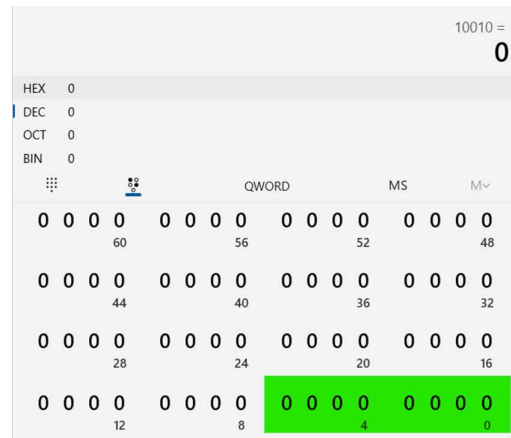

Virtual digital inputs are software-based inputs that simulate physical inputs in a BMS. They are used when physical inputs are not available or cannot be installed. E.g. they can be used for controlling the SmartGrid

1)

PIN	BIT
BMS Di 0	Bit 0
BMS Di 1	Bit 1
BMS Di 2	Bit 2
BMS Di 3	Bit 3
BMS Di 4	Bit 4
BMS Di 5	Bit 5
BMS Di 6	Bit 6
BMS Di 7	Bit 7

If register 1100 is 0 it means that all 8 bits (0 to 7) are open.

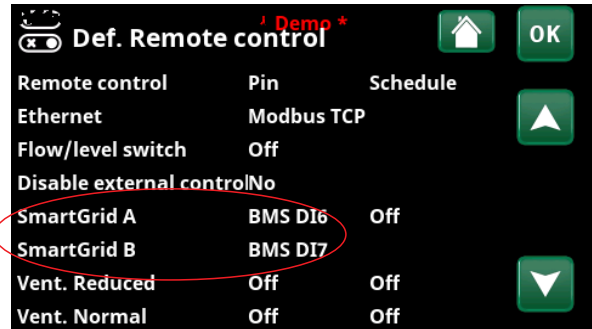

If register 1100 is 255 it means that all 8 bits (0 to 7) are closed.

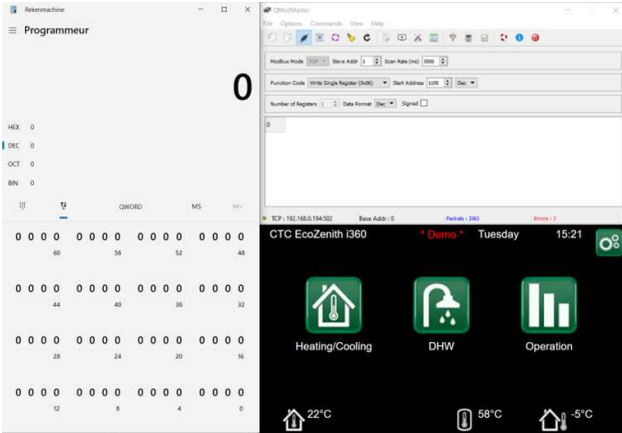

Example with SmartGrid

In this example we use digital input 6 (DI6) for SmartGrid A and digital input 7 (DI7) for SmartGrid B. To make it easy we assume other digital inputs are not used.

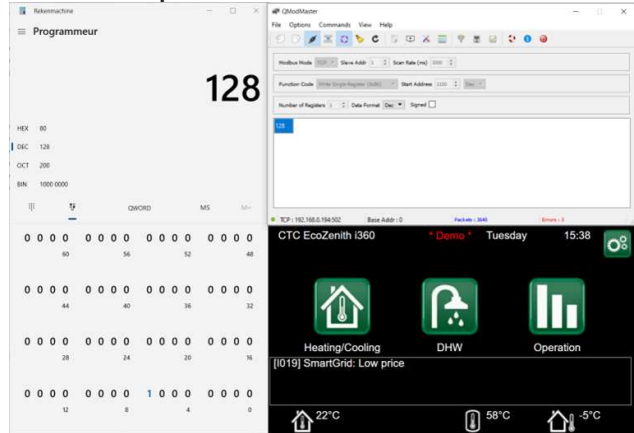

K22 (SG A)	K23 (SG B)	Function
Open	Open	Normal
Open	Closed	Low price
Closed	Closed	Overcapacity
Closed	Open	Blocking

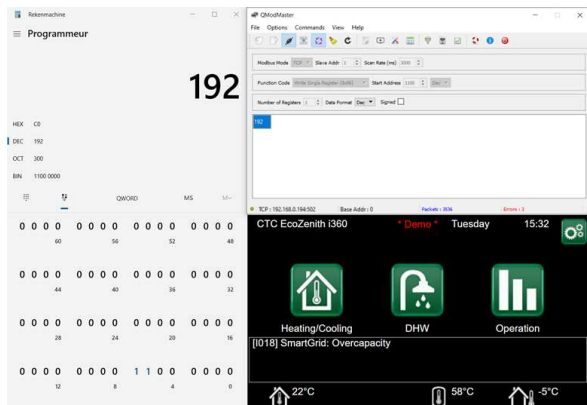

Function Normal

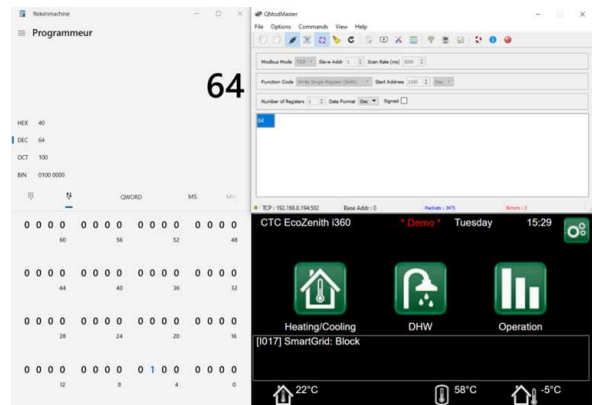

Function Low price

Function Overcapacity

Function Blocking

Remark: the priority for SmartGrid is:

1. Remote control (BMS/contact/...)
2. My uplink
3. Week schedule
4. Setting

If both contacts are open (normal working) there is of course no priority for BMS or contacts.

Alarms and information texts

For the alarms and info texts we work in 2 steps.

- First step (How many alarms/info texts do we have?)
- Second step (What is the exact alarm/info text?)

How many alarms/info texts do we have?

To know how many alarms/info texts you have, you should read register 65133.

You must look at the number in a hexadecimal way to know how many alarms and how many info text you have.

First 2 digits are for the info texts, the second 2 digits are for the alarms.

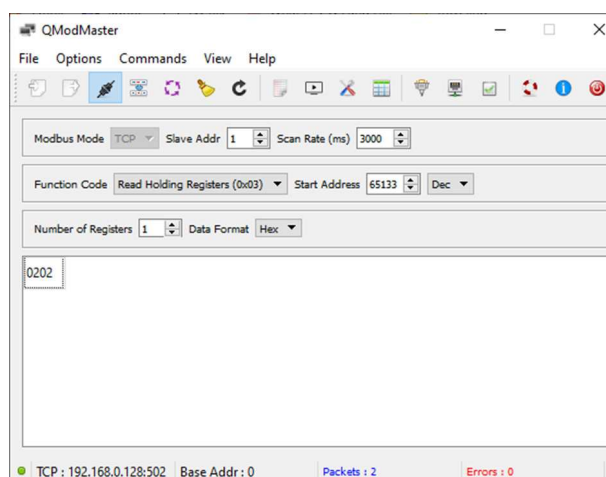

The absolute Max you can have, is FFFF (or 255 info texts and 255 alarms).

An Example:

#0202 (In hex.)

=> 02 = 2 information texts

=> 02 = 2 alarms

What is the exact alarm/ info text?

In the next step you can see the details of the alarms & info texts.

Reading register 65133 must precede this step as it populates the data in the buffers.

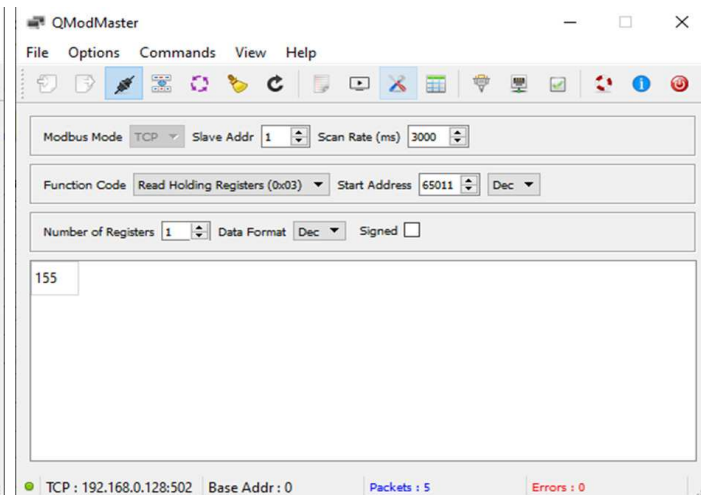

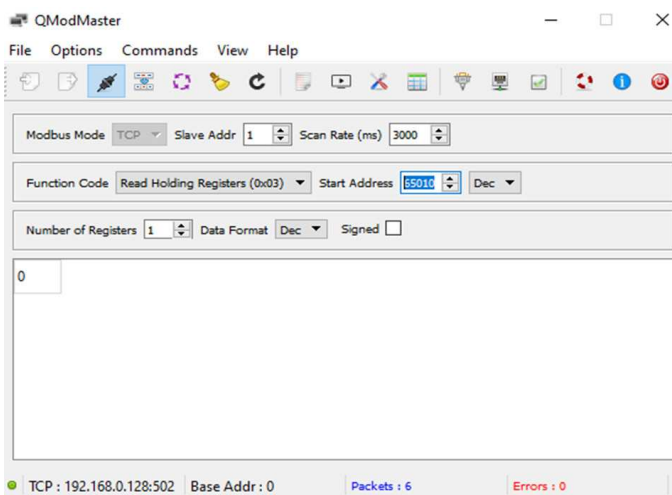

Registers	
Alarms	65010 - 65059
Info texts	65060 - 65069

Register	Alarm number	Explanation
65010	1	HP alarm (HP 1-10). '1' if it is an HP alarm, '0' if it is another alarm e.g., problem with sensor EcoZenith.
65011	1	The actual alarm code
65012	2	HP alarm (HP 1-10). '1' if it is an HP alarm, '0' if it is another alarm e.g., problem with sensor EcoZenith.
65013	2	The actual alarm code
65014	3	HP alarm (HP 1-10). '1' if it is an HP alarm, '0' if it is another alarm e.g., problem with sensor EcoZenith.
65015	3	The actual alarm code
65016	4	...

Register	Alarm number	Explanation
65060	1	HP info text (HP 1-10). '1' if it is an HP info text, '0' if it is another info text e.g., HC1 Heating off.
65061	1	The actual information text code
65062	2	HP info text (HP 1-10). '1' if it is an HP info text, '0' if it is another info text e.g., HC1 Heating off.
65063	2	The actual information text code
65064	3	...

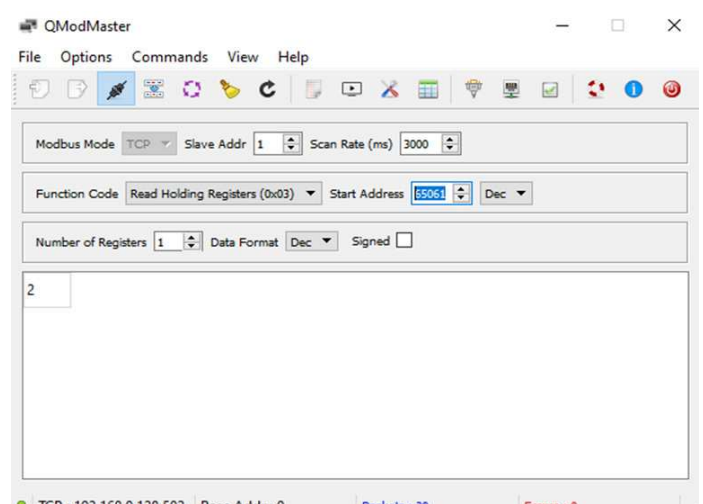

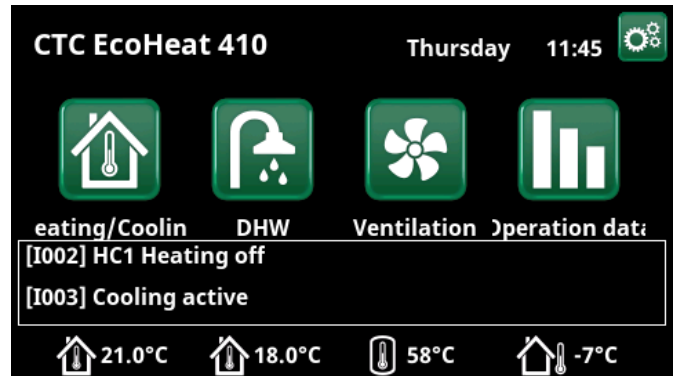

An example for alarms

Register	Alarm number	Value	Explanation
65010	1	0	Not a HP alarm
65011	1	E155	SmartControl
65012	2	0	Not a HP alarm
65013	2	E158	Alarm Vent. Filter
65014	3	0	NA, no 3rd alarm
65015	3	0	N/A

An example for information texts

Register	Alarm number	Value	Explanation
65060	1	0	Not a HP info
65061	1	12	HC1 Heating off
65062	2	0	Not a HP info
65063	2	13	Cooling active
65064	3	0	NA, no 3rd alarm
65065	3	0	N/A

Modbus address register

See the complete BMS list at the end of this document.

Note that not all parameters of the BMS list can be used for heatpump control if your display is not equipped with 3 ports (BMS via TCP/IP).

Modbus address register/complete BMS list

BMS Register	English	Description	RW	EcoHeat 400	EcoZenith i250	Gsi/CTC GS	EcoZenith i350/ EcoVent i350F	EcoZenith i550	Ecologic	Ecologic S
Value shall be updated before 5 minutes
